

WESTEND RADIATORS

YOUR GUIDE TO DPF, DOC, SCR, EGR CLEANING & REPLACEMENTS

3 REASONS TO CLEAN YOUR DIESEL FILTERS

1.

A clean filter **helps your engine operate properly** by keeping the exhaust gas pressure low.

2.

Proper cleaning is **the only way to remove non-combustible materials** that stay trapped in the DPF even after the regeneration button is hit.

3.

Regular cleaning **maintains horsepower and fuel economy.**

DPF BEFORE CLEANING

Soot and non combustible materials are caked onto the filter, resulting in high gas pressure, low power and poor fuel economy.

DPF AFTER CLEANING

Our state-of-the-art, high heat oven removes all particulate matter, allowing servicing intervals to be further apart in the future.

OUR CLEANING PROCESS

EXAMINE & CLEAN

We start with a **pressure drop reading** of your filter so we have a before and after comparison.

HEAVY-DUTY BAKE

We deep clean DPFs with a **heavy duty bake at 1,200°F** in our state-of-the-art oven to ensure all soot is removed.

FINAL READING

We provide you a **full pressure drop reading after** the cleaning so you can see the difference for yourself.

Since the 1980s, West End Radiators has been committed to providing industrial cooling solutions and a whole lot more.

We can clean DPFs, DOCs, SCRs and EGRs that are said to be **un-serviceable for a fraction of the cost** of purchasing new ones.

AFTERMARKET REPLACEMENTS IN STOCK

We carry a **complete line of DPF and DOC aftermarket parts** available for a wide range of OEMs.
